

A: Exploring Angles in a Circle Continued

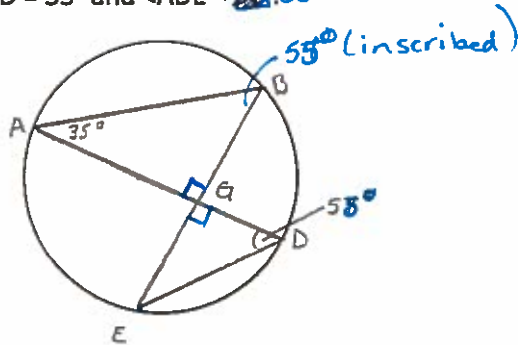

Remember the three rules of angles in a circle!

Examples:

1. If $\angle KJM = 17^\circ$, $\angle JML = 25^\circ$ and point C is the centre of the circle, what is the measure of each of the following angles?

- a. $\angle KLM$ 17° inscribed
 b. $\angle JKL$ 25° inscribed
 c. $\angle JCL$ 50° Central
 d. $\angle KCM$ 34° Central
2. In the diagram, $\angle BAD = 35^\circ$ and $\angle ADE = 55^\circ$

- a. What is the measure of $\angle ABE$? 57° inscribed
 b. What is the measure of $\angle AGB$? $180^\circ - 35^\circ - 55^\circ = 90^\circ$
 c. What type of triangle is $\triangle ABG$? Right triangle
 d. What is the measure of $\angle DGE$? 90° opposite angles

Handwritten text, possibly a list of items or a table.

3. Find the unknown angle measures, x and y in each diagram. Where C is labeled, it is the centre of the circle.

$$140^\circ + x = 180^\circ$$

$$x = 40^\circ$$

$$x = y \text{ b/c inscribed}$$

$$y = 40^\circ$$

$$x = \frac{180^\circ}{3} \text{ equilateral triangle} \\ = 60^\circ$$

$$y = 60 \times 2 \\ = 120^\circ \text{ central angle}$$

4. For the following calculate the value of x .

$$\angle ABD = \angle AED \text{ inscribed}$$

$$6x = 2x + 36$$

$$-2x \quad -2x$$

$$\frac{3x}{3} = \frac{36}{3}$$

$$x = 12$$

$$\frac{\angle CED}{2} = \angle EFD \text{ central}$$

$$\frac{8x + 2}{2} = 6x - 3$$

$$4x + 1 = 6x - 3$$

$$-4x \quad -4x$$

$$1 = 2x - 3$$

$$+3 \quad +3$$

$$\frac{32}{2} = \frac{2x}{2}$$

$$16 = x$$
