

B: Exploring the Pythagorean Relationship

For a right triangle:

→ The sum of areas a^2 and b^2 will equal the area of the square attached to the hypotenuse.

 hypotenuse (always across from the right, (90°) angle!)

Pythagorean Theorem

$$a^2 + b^2 = c^2$$

* c must always be the hypotenuse!
it is the longest side.

Examples:

1. A right triangle has side lengths 35 mm, 70 mm, and 78.26 mm.
 - a) Draw a square on each side of the triangle.

b) What are the areas of each square?

$$\begin{aligned} A_1 &= s^2 \\ &= (70)^2 \\ &= 4900 \text{ mm}^2 \end{aligned}$$

$$\begin{aligned} A_2 &= s^2 \\ &= 35^2 \\ &= 1225 \text{ mm}^2 \end{aligned}$$

$$\begin{aligned} A_3 &= s^2 \\ &= (78.26)^2 \\ &= 6124.63 \text{ mm}^2 \end{aligned}$$

e) Write an addition statement to the nearest whole number with the three areas.

$$\begin{array}{r} \text{area of triangle} + \text{area of triangle} = \text{area of "hypotenuse" square} \\ a^2 + b^2 = c^2 \end{array}$$

$$4900 \text{ mm}^2 + 1225 \text{ mm}^2 = 6125 \text{ mm}^2$$

2. Is the triangle shown a right triangle?

In a right triangle:

$$A_1 + A_2 = A_3 \rightarrow \text{must be attached to hypotenuse}$$

$$45 \text{ cm}^2 + 20 \text{ cm}^2 = 65 \text{ cm}^2 \quad * \text{ Hypotenuse area} = 55 \text{ cm}^2$$

\therefore not a right triangle.

3. A triangle has side lengths of 7m, 8m and 10~~m~~^m.
Is the triangle a right triangle?

$$a^2 + b^2 = c^2 \quad c \text{ must be hypotenuse.}$$

$$7^2 + 8^2 = 10^2$$

$$49 + 64 = 100$$

$$113 \neq 100$$

The triangle is not a right triangle

4] Use the pythagorean relationship to find the unknown area.

→ hypotenuse area

$$A_1 + A_2 = A_3$$

$$576 + 100 = A_3$$

$$676 \text{ mm}^2 = A_3$$

Assignment Pg. 92 # 5-11 (odd questions), 12 (a & c), 13, 15, 17

Faint handwritten text at the top of the page, possibly a title or header.

Faint handwritten text in the middle of the page, possibly a list or a set of instructions.
